

## ABSTRACT

A raw material supplier manufactures raw material for a plastic substrate by means of a raw material manufacturing device. A disk presser manufactures a substrate from the raw material by means of an optical disk manufacturing device, manufactures an optical disk by laminating the substrate sequentially with the recording layer and the reflecting layer, and records predetermined information on the disk by means of an information recording device. The disk presser recovers a pure and lucent plastic substrate from a disk fallen into disuse, so as to supply the substrate to the raw material supplier.
